

Assignment 1:

Assignment 2:

The first screenshot shows the `gameLevel.java` file in the Apache NetBeans IDE. It defines a `gameLevel` interface that extends `Cloneable` and implements methods `clone()`, `addObstacles()`, `placeEnemy()`, and `pickTerrain()`. Two classes, `iceLevel` and `lavaLevel`, implement this interface. `iceLevel` overrides `clone()` to return a new `iceLevel` object and the other methods to print messages about adding glaciers, deploying polar bears, and covering area with snow. `lavaLevel` overrides `clone()` to return a new `lavaLevel` object and the other methods to print messages about adding molten lava rocks, deploying rock creatures, and covering area with lava and obsidian.

The second screenshot shows the `PatternsLab3.java` file, which demonstrates the use of the `gameLevel` interface. It creates a `DocumentTemplate` object and uses it to create a `thinkPiece` object. It then creates two `gameLevel` objects, `level1` and `level2`, using the `clone()` method of the `gameLevel` interface. It then calls the `addObstacles()`, `pickTerrain()`, and `placeEnemy()` methods on these objects.

The output window shows the following text:

```
run:
An article template is created.
changing colors, font, and borders.
adding glaciers.
covering area with snow.
deploying polar bears.
adding molten lava rocks.
covering area with lava and obsidian.
deploying rock creatures.
BUILD SUCCESSFUL (total time: 0 seconds)
```
